IOWA TROPHY DEER RECORDS 1953 - 1991

Prepared by:

LEE GLADFELTER TROPHY RECORDS COORDINATOR

WILDLIFE BUREAU
FISH & WILDLIFE DIVISION

Iowa Department of Natural Resources
Larry J. Wilson, Director

FOREWORD

The Iowa Trophy Deer records were established in 1969 to recognize hunters that harvest trophy white-tailed deer under rules of fair chase. In order to qualify for an award, antlers must be measured by a certified state, Boone and Crockett or Pope and Young Club measurer. Hunters must wait at least 60 days before antlers can be officially measured to allow for proper shrinkage. Antlers are measured according to scoring techniques developed by the Boone and Crockett Club. Antlers can be measured by contacting the measurer nearest you (see table of contents for list) for an appointment.

Entries are limited to deer taken by fair chase. This means that hunters must harvest animals during authorized hunting seasons, using legal methods of take and in an ethical and sportsmanlike manner. Antlers that are picked up or found, taken from road-killed deer, illegally taken, purchased, taken outside of Iowa or obtained by the owner in some manner other than by hunting, do not qualify for entry into Iowa records.

Antlers can be entered into 6 different categories depending on type of weapon used and conformation of antlers. Minimum entry scores for each category are:

- | | |
|--|---|
| 1. Shotgun typical
1953-1973 = 140 points*
1974-present = 150 points | 2. Shotgun nontypical
1953-1973 = 160 points*
1974-present = 170 points |
| 3. Archery typical
1953-1973 = 115 points*
1974-present = 135 points | 4. Archery nontypical
1953-1973 = 120 points*
1974-present = 155 points |
| 5. Muzzleloader typical
Present = 150 points | 6. Muzzleloader nontypical
Present = 170 points |

*These original minimum scores were for racks taken and measured during 1953-1973. Racks taken during those years but not measured until after 1973 would have to qualify under present minimums. Minimum qualifying scores were raised in 1974 to more accurately reflect trophy deer for Iowa conditions.

All scoresheets submitted by official scorers have been reviewed for mathematical and procedural errors. Some scores have been corrected because of mathematical or procedural errors. Corrections to trophy records can be made for misspelled names of trophy owners or incorrect record category, county of kill, year, city of residence, etc. by sending a letter describing errors to Iowa Trophy Deer Records, Wallace State Office Bldg., East 9th and Grand Ave., Des Moines, IA 50319.

ACKNOWLEDGEMENTS

I wish to acknowledge the many people that make Iowa's trophy deer records program work. My thanks to Tami Pavlicek and Julie Sparks for records list preparation for the Conservationist magazine, Marilyn Carter, Mamie Saulter and many other support staff for processing and mailing record certificates and Larry Pool for front cover design for this publication. Also, thanks to Sonny Satre for administering the trophy records from 1969-1980. Special thanks to Sandy Monen for computer entry of records data and to Jim Kienzler for format preparation for this record book. A big thank you to all the dedicated official state record scorers who volunteer their time to measure trophy racks, process and mail record forms, answer questions and implement the records program as a service to sportspersons across the state. The records program is funded by the sale of hunting licenses and Pittman-Robertson funds derived from the sale of sporting arms, ammunition and equipment.

FINAL SCORE		8	Remarks: (Mention any abnormalities)							

Signature of official measurer _____ Date _____

Instructions for Measurers:

All measurements must be made with a flexible steel tape to the nearest one-eighth of an inch. Wherever it is necessary to change direction of measurement, mark a control point and swing tape at this point or use a flexible steel cable to measure length of points and main beams. To simplify addition, please enter fractional figures in eighths. Official measurements cannot be taken for at least 60 days after the animal was killed. Please check the type of weapon used to take the animal (shotgun, muzzleloader, or bow and arrow) at the top of the form. Also double check all your addition and difference column calculations and sign and date the form. Supplementary Data Measurements indicate conformation of the trophy, and none of the figures in Lines A, B and C are to be included in the score.

A. Number of Points on each Antler. To be counted a point, a projection must be at least one inch long with the length exceeding width at one inch or more of length. All points are measured from tip of point to nearest edge of beam as illustrated. Beam tip is counted as a point but not measured as a point. Abnormal points are also included in the total point count.

B. Tip to Tip Spread is measured between tips of main beams.

C. Greatest Spread is measured between perpendiculars at right angle to the center line of the skull at widest part whether across main beams or points.

D. Inside Spread of Main Beams is measured at right angle to the center line of the skull at widest point between main beams. Enter this measurement again in "Spread Credit" column if it is less than or equal to the length of longer main beam; if longer, enter longer main beam length for "Spread Credit."

E. Total of Lengths of Abnormal Points. Abnormal points are generally considered to be those nontypical in location (such as points originating from another point or from the bottom or sides of main beams) or extra points beyond the normal pattern of points. Measure in the same way as normal points and enter in appropriate blanks. If there is 10 inches or more of abnormal points the rack should be entered in the nontypical trophy category.

F. Length of Main Beam is measured from lowest outside edge of burr over outer curve to the most distant point of the main beam. The point of beginning is that point on the burr where the center line along the outer curve of the beam intersects the burr.

G. Length of Normal Points. Normal points project from the top of the main beams. They are measured from nearest edge of main beam over outer curve to tip. To determine nearest edge (top edge) of beam, lay the tape along the outer curve of the beam so that the top edge of the tape coincides with the top edge of the beam on both sides of that point. Draw line along top edge of tape. This line will be base line from which point is measured.

H. Circumferences. Circumferences of the main beam at the smallest place is taken in four locations between normal points along each beam. If first point is missing, take H-1 and H-2 at smallest place between burr and second point. If fourth point is missing, take H-4 halfway between third point and tip of main beam.

Send form to: Trophy Deer Records
